### Empire Hydrogen Completes Fish Farm Installation

**Sidney, BC:** Empire Hydrogen Energy Systems is pleased to have completed the first installation on a fish farm generator near Campbell River, British Columbia.

This unit, installed at the Cermaq Venture Point fish farm will be used to evaluate Empire's Fuel Enhancement System for potential roll out on 40 generators stretching up the BC coast.

Generators run 24 hours a day at fish farms. They are used to power and light the floating camps, pump oxygen into the pens and operate automated feeding systems.

The cost of transporting fuel to these remote locations by small boat makes Empire's system even more important in reducing fuel use.

However, to maintain the pristine environment in which they operate, Cermaq has expressed special interest in how it will reduce diesel particulates, greenhouse gas and NOx emissions coming from their generators.

Empire's Executive Vice President, Andrew Evans, travelled to the fish farm to train a local mechanic and oversee the first installation. It was performed by Discovery Diesel Electric, a local company that is tasked with long term maintenance on many diesel engines for logging companies and fish farms across the region. With successful results at the fish farm we have encouraged DDE to promote Empire's Fuel Enhancement System to their other customers.

For more information please contact Sven Tjelta or Andrew Evans at Empire Hydrogen at 778.426.0911.
