

Empire Hydrogen installation at Lafarge Concrete

March 1, 2021: Sidney, BC: Empire Hydrogen is pleased to announce the installation of two Fuel Enhancement Systems at Lafarge Concrete's Cannon Gravel Pit near Mission, BC. For these first evaluation installations, Lafarge has chosen a Caterpillar loader and a Caterpillar generator used to power the rock crushing operation.

The Lafarge loader will be run in rough, off-road conditions and at steep angles. This installation will prove that Empire's Fuel Enhancement System is designed for the most rugged situations.

The Lafarge generator is operated at full speed for many hours each day to keep up with their ever increasing demand for concrete and aggregate products.

Lafarge Canada, with hundreds of trucks across the country, is a division of LafargeHolcim, the world's largest cement company. Lafarge is proudly making tremendous advancements towards their goal of net-zero construction with the introduction of the ECOPact range of sustainable concrete with 30% to 100% less carbon emissions compared to standard concrete. The emissions reductions provided by Empire's Fuel Enhancement System will go a long way towards helping Lafarge meet these ambitious goals.
