Empire Hydrogen Installs on Langtoria Greenline

Sidney, BC: Empire Hydrogen Energy Systems has installed our Fuel Enhancement System on the Langtoria Greenline; a daily coach commuter service between the rapidly growing suburb of Langford and Victoria's downtown core. Passengers are encouraged to work on their laptops, read a newspaper and enjoy their coffee while relaxing in high back seats and air-conditioned comfort. This is the natural way for business people to bypass the horrible "Colwood Crawl" commute.

The Greenline is operated by Wilson's Transportation, Vancouver Island's largest transportation company with 140 vehicles. Our hope is that the Fuel Enhancement System provides an obvious benefit in fuel economy and emissions reductions to make further bus installations self evident.

This was the first installation performed by TruckPro/Traction. TruckPro is the largest network of heavy vehicle repair centres in Canada with more than 120 locations. Traction, with 100 stores, is the Canadian leader in heavy vehicle replacement parts. The local TruckPro/Traction dealerships are operated from a single location just ½ mile from Empire in Sidney. We hope that this successful installation is the first step to a much wider retailing and installation relationship.

Empire Hydrogen's Fuel Enhancement System can be installed on any large diesel truck, bus or generator. Advanced electronics produce hydrogen and oxygen on demand from distilled water. A minute amount of these H₂O₂ gasses flow through the engine's air intake to the cylinders. Hydrogen and oxygen burn ten times as fast as diesel, dramatically expanding the flame front and causing the fuel to burn faster, cleaner and more completely. This results in more power with less fuel consumption, less greenhouse gas, dramatically less smog producing diesel particulates and NO_x, cleaner pistons and cleaner exhaust.
